DAHLIAS

WHEN AND HOW TO PLANT

The Dahlia being essentially a fall blooming flower that produces the best results at that time, it should not be planted too early. The first 10 days of June is the ideal planting time and they can be planted as late as early July. For best results Dahlias really should be staked and these stakes should be placed in the ground before the tuber is planted. In planting, the tuber should be laid flat, not on end, with the eye or sprout up. Plant 4 inches under ground and about 3 feet apart. Don't discard your small tubers. A tuber cannot be judged by its size, a small one having as good if not a better chance than a large one.

DISBUDDING

When the plants are 6 to 8 inches high, pull up all but the one or two best stalks. After these have produced three sets of leaves, pinch out the top so the plant may acquire the branching habit. This will give you twice as many blooms and keep your plant more compact.

CULTIVATION

It is extremely important to hoe frequently to keep down weeds and prevent soil from forming a crust on the surface. Do not water except in case of a very dry season; then but once or twice a week. Wet grounds decays the tubers and frequent watering produces surface roots which are detrimental.

GLADIOLI

WHEN, WHERE AND HOW TO PLANT

For continuous bloom, plant Gladioli every 10 days to two weeks from mid-April to July 10. Plant in open, sunny places, not too near buildings, foundations, etc. Gladioli will thrive in any kind of fertile soil. Spade the ground at least 8 inches deep. Make trenches for the bulbs, placing them 4 inches deep and about 4 inches apart. If soil is dry when planted, water thoroughly. After planting, keep soil loose and free from weeds, never permitting the ground to form a crust after heavy rains but work ground as soon as it becomes dry enough to work nicely. Water when necessary, then soak them well. Unless the weather is very dry, watering at intervals of a week or 10 days usually is enough.

CUTTING

Cut the flower spike when first bud is open. Keep spike in water, changing the water daily; pull off faded flowers and shorten spikes in proportion to the number of faded flowers removed. Use a sharp knife as shears bruise and close the channels in stem so water cannot pass through. When cutting the spike from the plant, allow not less than 4 leaves to mature the bulb.

CANNAS

WHEN, WHERE AND HOW TO PLANT

Cannas should not be planted before May after all danger of frost is past and the ground is warmed. Canna roots may be started in boxes in the house, setting them close together in sand, sawdust or moss. This gives them an early start and avoids rotting which so often occurs when roots are placed outdoors too early. Cannas like a sunny position and a sandy rich, moist soil. Plant roots one foot apart for mass effect and three feet apart for specimen plants. After frost has blackened the leaves, the roots should be dug and stored in boxes of sand in a cool, dry cellar, the roots packed upside-down so they may dry thoroughly.

GARDEN IRIS

WHERE AND HOW TO PLANT

The Iris family is very partial to a sunny, well drained position, requiring moisture but does not like a naturally soggy ground. Spade the soil deeply but plant shallow so that the fleshy part of the root lies in a horizontal position and is barely covered. Spread out the roots and press soil firmly about the plant. Do not water unless the soil is very dry and then only to settle the soil about the roots. Set plants about a foot apart in rows or clumps. Three or more plants soon make a mass effect. Do not use stable manure with your Iris. If the ground lacks lime it could be improved by mixing some well slacked lime with the soil. Transplant when the growth becomes crowded, about every third year.

JAPANESE IRIS

This variety requires practically the same care and attention in planting and cultivation as does Garden Iris except that it should be watered freely at blooming time and neither bone meal nor lime should be used for Japanese Iris.
